### Chapter 13

# Wave Aspect of Light - Diffraction

Prepared and Presented by: **Mr. Mohamad Seif**

# OBJECTIVES

**1 Revision about waves**

**2 Properties of Visible Light**

ACADEMY

# Revision about waves

## What is a wave?

**A wave is a moving vibration.  
( It is the propagation of a vibration).**

## Remark:

**Waves transport energy and  
does not transport matter**

# Revision about waves

**A wave is a moving vibration, so it has the same characteristics of a vibration:**

- **Amplitude:**
- **Period:**
- **Frequency:**
- **Wavelength:** A wave move, this means it covers a certain distance called wavelength ( $\lambda$ ).
- **Speed of wave.**

# Revision about waves

## 1. Amplitude (a):

Amplitude is the distance between axis and maximum (crest) or minimum point (trough).

## 2. Period (T):

Period is the time for one wave, in seconds.

## 3. Frequency (f):

Frequency is the number of waves per time. For one wave.

$$f = \frac{1}{T}$$

# Revision about waves

## 4. Wavelength ( $\lambda$ ):

Wavelength is the distance traveled.

## 5. Speed (V):

Speed is the distance covered by the wave per unit of time. It is in m/s

$$V = \frac{d}{t} \quad \text{For one wave}$$

$$V = \frac{\lambda}{T}$$

$$V = \lambda \cdot f$$

# Revision about waves

# Revision about waves

## Mechanical waves:

It is a wave that needs a medium to propagate, so it can't propagate in vacuum, such as sound wave, water wave

## Electromagnetic waves:

It is a wave that **doesn't require** medium to propagate. This wave can propagate in medium or in vacuum, such as light waves

# Revision about waves

## Transverse wave :

Causes the particles of the medium vibrate  $\perp$  to the direction of the wave motion  
water waves, light waves...

## Longitudinal wave:

Causes the particles of the medium vibrate parallel to the direction of the wave motion.  
Sound waves, spring...

# Properties of visible light

Light undergoes many phenomena including:

- 1. Reflection of light:** if light hits a mirror or any reflecting surface, it is reflected such that the angle of reflection is equal to the angle of incidence.
- 2. Refraction of light:** if light moves from one transparent medium to another, it changes its direction.
- 3. Rectilinear propagation of light:** in a homogeneous and transparent medium (air, water, glass...), light propagates in straight lines.
- 4. Diffraction** of light, Interference of light and photo-electric effect are new phenomenon will be studied

# Properties of visible light

- Light is made up of oscillating electric and magnetic fields.
- Light is an electromagnetic radiation.
- A light radiation is sinusoidal transverse wave that propagates in a straight line in a homogenous medium.
- The speed of light in vacuum or still air is:

$$c = 3 \times 10^8 \text{ m/s}$$

- The wavelength of light of speed  $c$  and frequency  $\nu$  in vacuum is:

$$\lambda = \frac{c}{\nu}$$

# Properties of visible light

The speed of light in a medium of index of refraction  $n$  is:

$$V = \frac{c}{n}$$

The wavelength of light of frequency  $\nu'$  and speed  $V$  in a medium of index  $n$  is:

$$\lambda' = \frac{V}{\nu'} = \frac{c}{n\nu} = \frac{\lambda}{n}$$

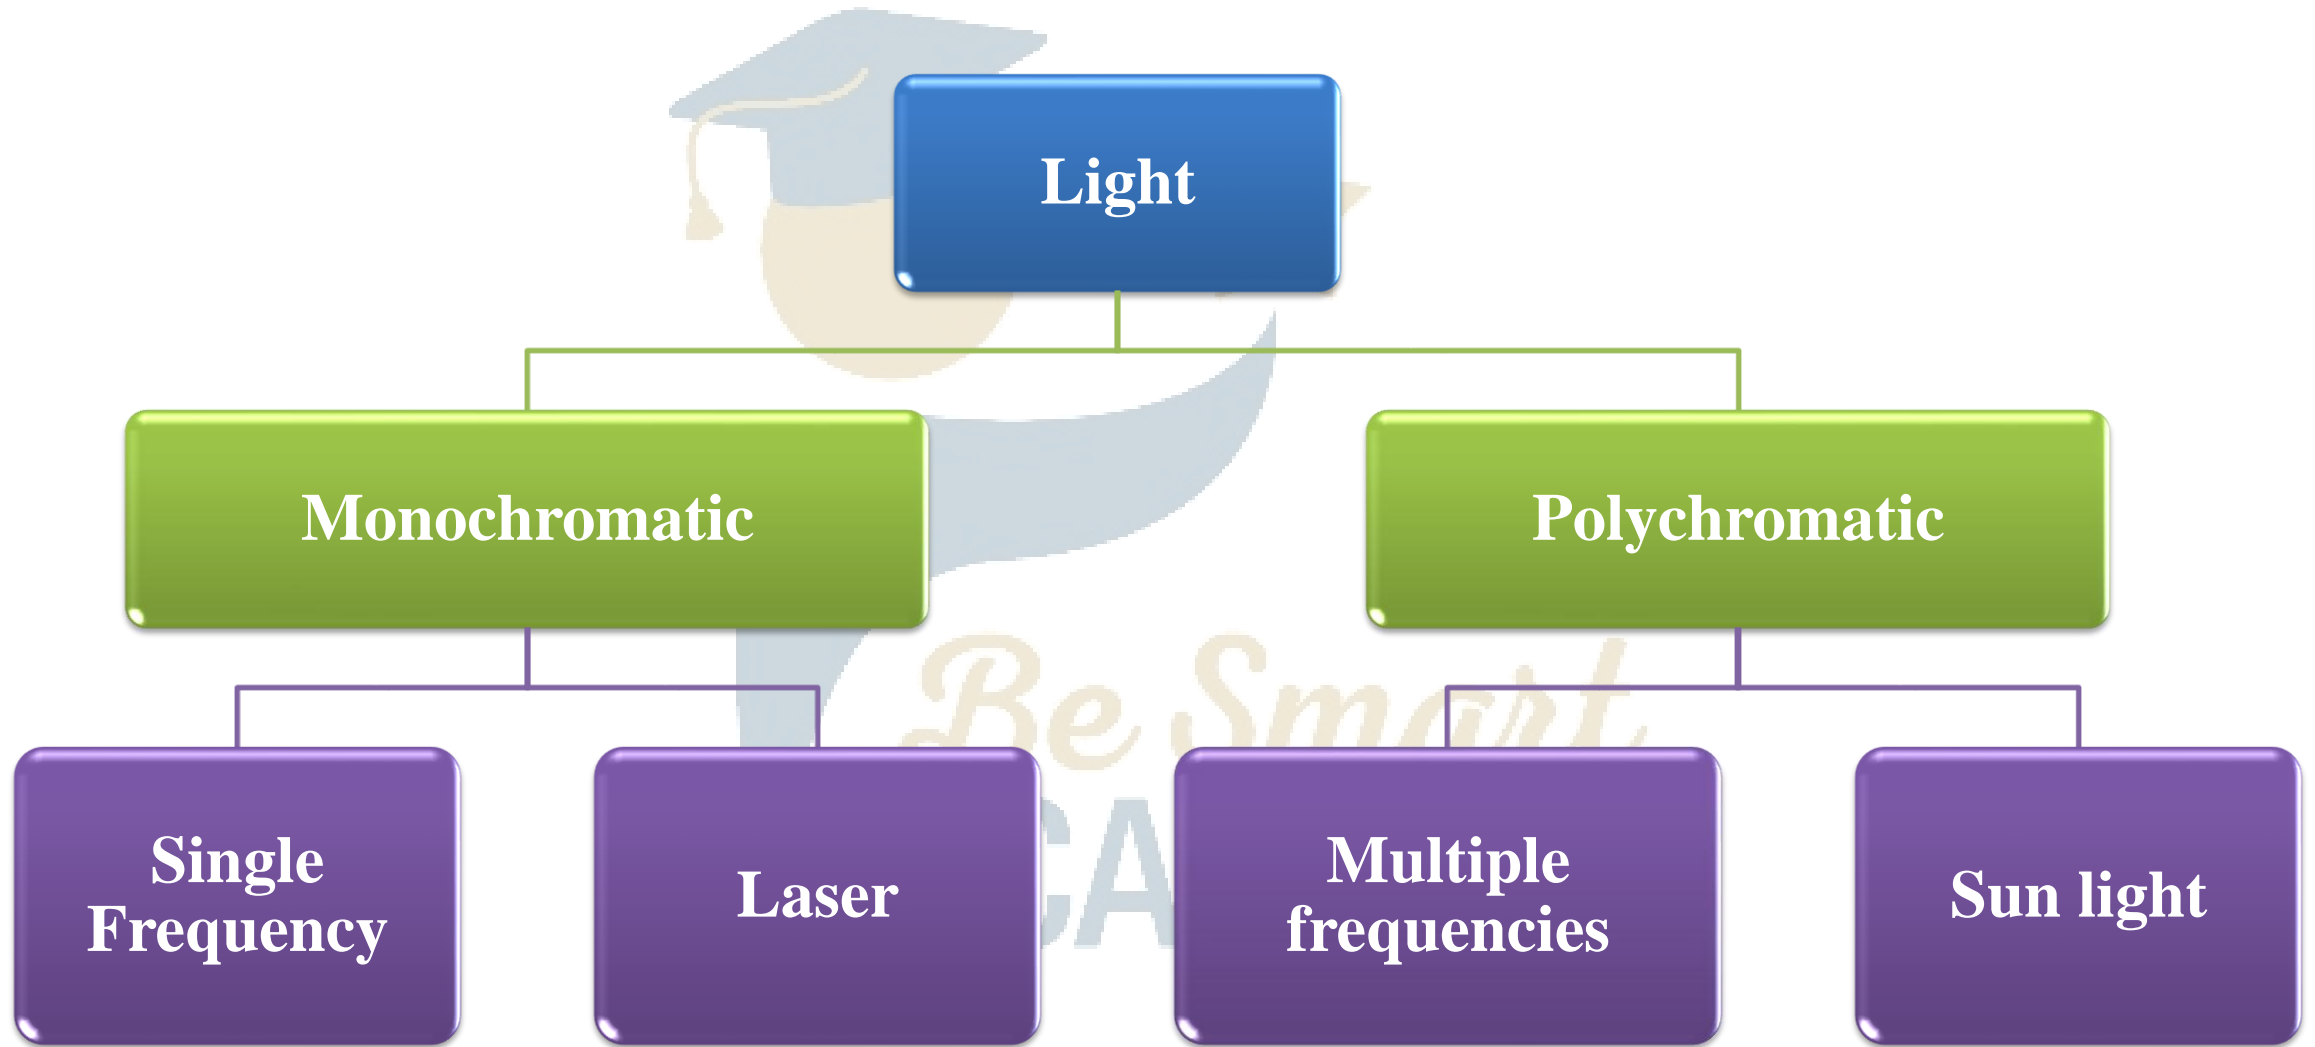

The wavelength range of visible light in vacuum is:

$$400\text{nm} \leq \lambda_{\text{visible}} \leq 750\text{nm}$$

# Properties of visible light

# Properties of visible light

# Properties of visible light

## Monochromatic light:

**Monochromatic light:** is light consists of one radiation, one color, one wavelength and one frequency. Example: laser light.

## Polychromatic light:

**Polychromatic light:** is a light consists of many radiations (colors) and many frequencies. Example white or sun light

# Properties of visible light

## Dispersion of light:

Dispersion of light is the decomposition of light into its initial components.

We can distinguish between monochromatic and polychromatic light using prism experiment

### Chapter 13

# Wave Aspect of Light - Diffraction

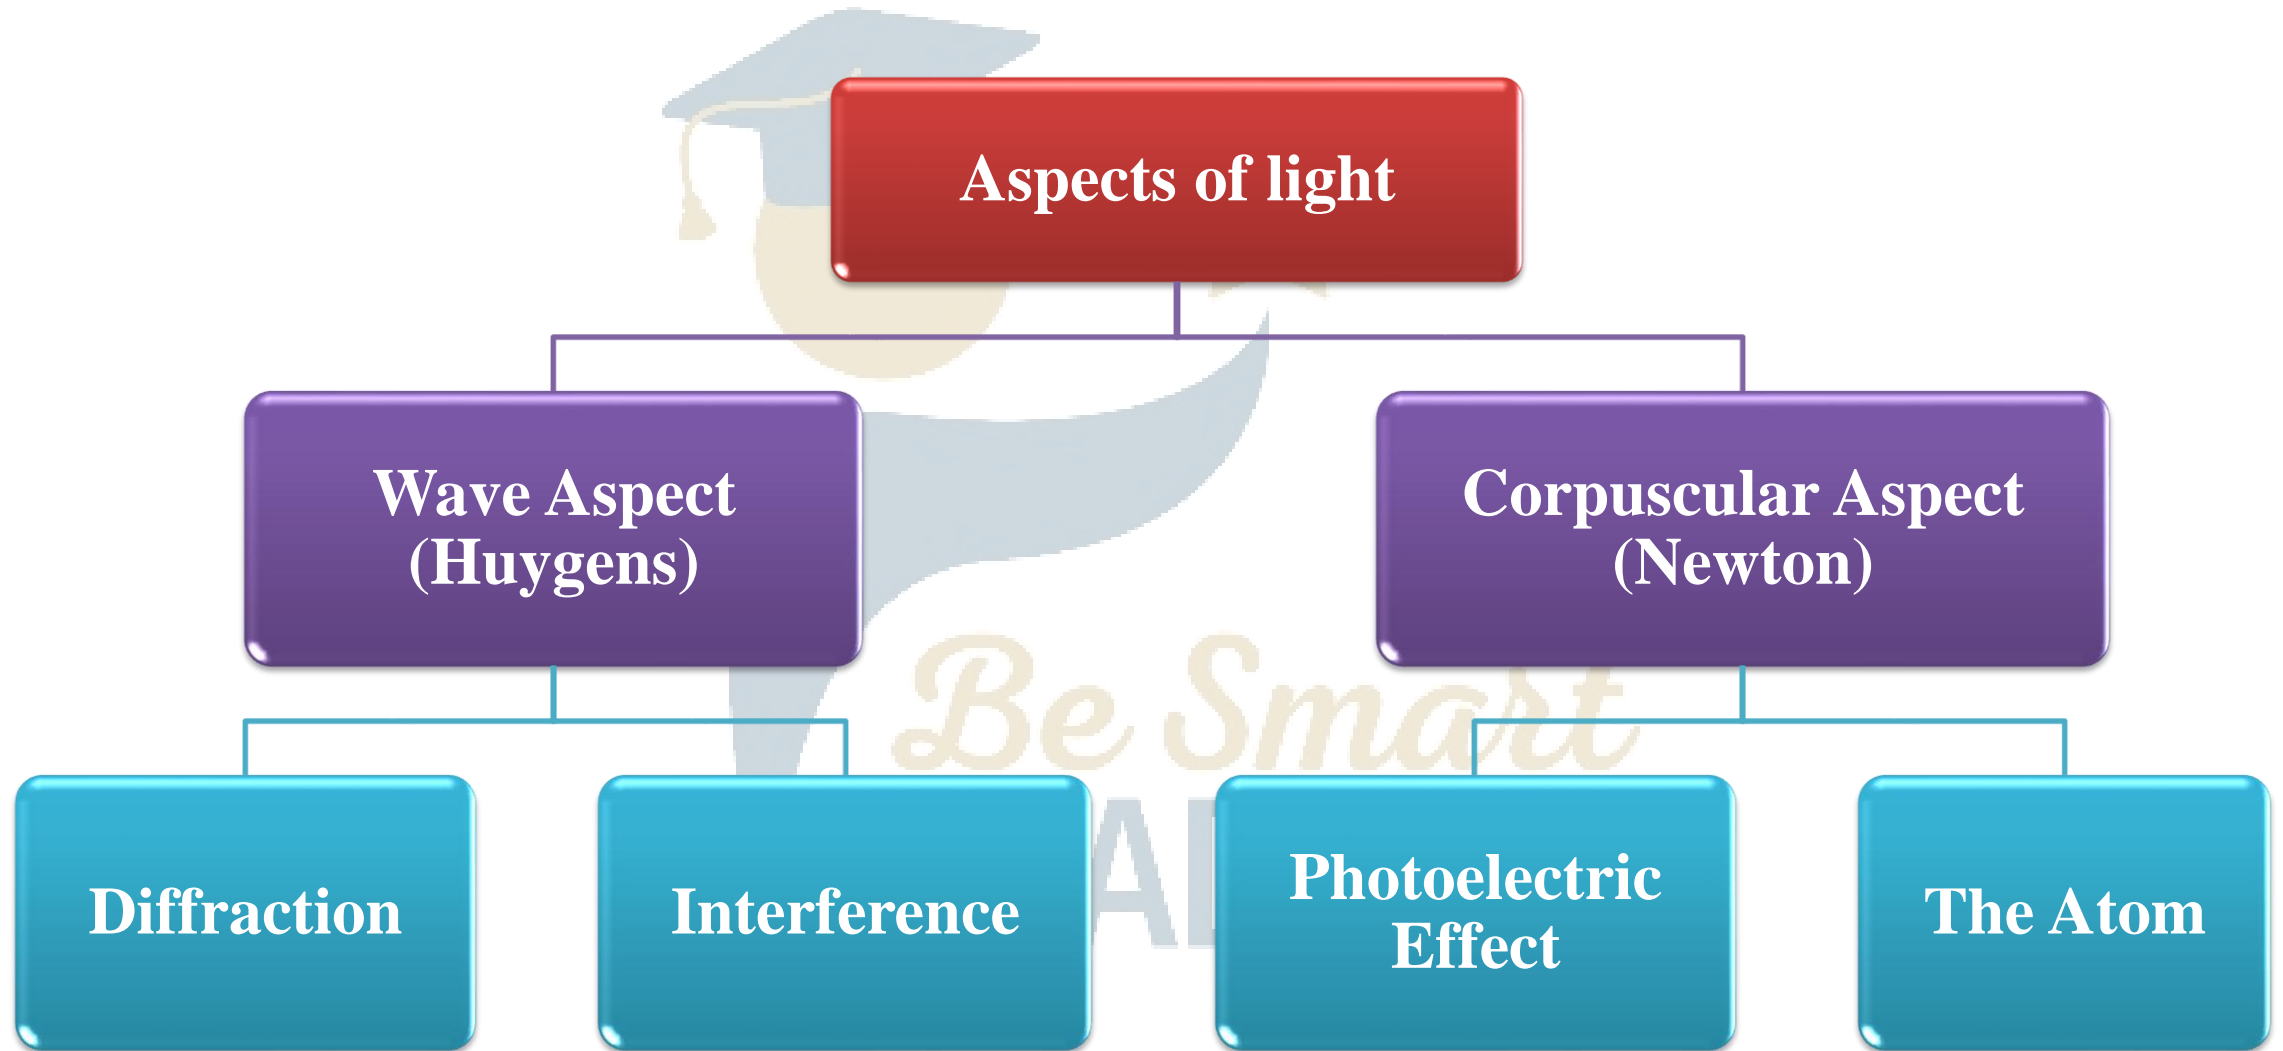

Prepared and Presented by: **Mr. Mohamad Seif**

# OBJECTIVES

- 1 **Definition of Diffraction of light**
- 2 **Description of Diffraction Pattern**
- 3 **Interpretation of Diffraction Pattern**

# Diffraction of light

# Diffraction of light

**Diffraction:** is a phenomenon that takes place when the light passes through a **very small opening**(slit) ( $a \leq 1mm$ ).

# Diffraction of light

# Diffraction of light

In the illuminated region some points are **more illuminated** called bright fringes (B.F), and some others less illuminated and called dark fringes (D.F).

# Diffraction of light

**When the light passes through a small circular hole, diffraction takes place .**

# Diffraction of light

When the width ( $a$ ) of the used slit is large ( $a=1\text{cm}$ ) compared to the wavelength ( $\lambda$ ), a rectilinear propagation of light occur, and **no diffraction takes place.**

# Description of Diffraction Pattern

## The characteristics of the diffraction pattern obtained:

1

- Alternating bright and dark fringes

2

- The size of the central bright fringe is double that of any other bright fringe

3

- The direction of the pattern of fringes is perpendicular to that of the slit

4

- Central bright fringe of maximum intensity

# Interpretation of Diffraction Pattern

From the phenomenon of diffraction, we can deduce:

1. Diffraction gives an evidence of the wave aspect of light .

2. Diffraction needs a monochromatic light to takes place.

3. Light is an electromagnetic wave.

# The End

## Unit III

### Chapter 13

# Wave Aspect of Light - Diffraction

Prepared and Presented by: **Mr. Mohamad Seif**

# OBJECTIVES

**4 Angular width of the dark fringes**

**5 Angular width of the central bright fringe**

**6 Linear width of the central fringe**

# Angular width of the dark fringes

The dark fringe of  $n$ th order makes an angle  $\theta_n$ :

$$\sin \theta_n = \frac{n\lambda}{a}$$

The angles supposed to be very small:  
 $\sin \theta_n \approx \tan \theta \approx \theta$

$$\theta_n = \frac{n\lambda}{a}$$

- $\theta_n$ : Angle of diffraction of the center of the  $n^{\text{th}}$  D.F.
- $n$ : Order of the D.F.  $n = \mp 1; \mp 2; \mp 3; \dots$
- $a$ : Width of the slit

# Angular width of the dark fringes

# Angular width of the central bright fringe

$$\theta_n = \frac{n\lambda}{a}$$

For  $n = \mp 1$ : 1<sup>st</sup> dark fringe  $\theta_1 = \mp \frac{\lambda}{a}$

For  $n = \mp 2$ : 2<sup>nd</sup> dark fringe  $\theta_2 = \mp 2 \frac{\lambda}{a}$

The angular width of C.B.F

$$\alpha = 2\theta_1 = \frac{2\lambda}{a}$$

## Linear width of the central bright fringe (L):

The angle between the center of C.B.F and 1<sup>st</sup> D.F is  $\theta_1$ :

$$\theta_1 = \frac{\lambda}{a}$$

$$\tan \theta_1 = \frac{\text{opp}}{\text{adj}} = \frac{L/2}{D} = \frac{L}{2D}$$

The angles supposed to be very small:

$$\sin \theta_1 \approx \tan \theta_1 \approx \theta_1$$

$$\theta_1 = \theta_1$$

$$\frac{\lambda}{a} = \frac{L}{2D}$$

$$L = \frac{2\lambda D}{a}$$

# The End

## Unit III

### Chapter 13

# Wave Aspect of Light - Diffraction

Prepared and Presented by: **Mr. Mohamad Seif**

# OBJECTIVES

**7 Position of any dark fringe**

**8 Intensity distribution of a Diffraction Pattern**

ACADEMY

## Position of nth dark fringe ( $x_n$ )

$$\theta_n = \frac{n\lambda}{a}$$

From the geometry of the figure:

$$\tan \theta_n = \frac{x_n}{D} \Rightarrow$$

$$\theta_n = \frac{x_n}{D}$$

$$\theta_n = \theta_n$$

$$\frac{n\lambda}{a} = \frac{x_n}{D}$$

$$x_n = \frac{n\lambda D}{a}$$

# Position of any dark fringe

## Application 1:

A laser emits light of wavelength  $\lambda$  that falls normally on horizontal wire of diameter  $a$ .

The diffracted pattern is observed on a screen parallel to the wire and situated at  $D = 2\text{m}$ . Figure 1.

Figure 1

- 1) When the thin wire is illuminated by a laser, the light diffracts.  
Give the definition of diffraction phenomenon.
- 2) Determine the expression of the angular position of the first dark point obtained on the screen in terms  $\lambda$  &  $a$ .

# Position of any dark fringe

1) When the thin wire is illuminated by a laser, the light diffracts. Give the definition of diffraction phenomenon.

**Diffraction is a phenomenon that takes place when the light passes through a very small opening, called slit ( $a \leq 1\text{mm}$ ).**

Figure 1

## Position of any dark fringe

2) Determine the expression of the angular position of the first dark point obtained on the screen in terms  $\lambda$  &  $a$ .

The position of any dark fringe is given by:

$$\sin \theta_n \approx \theta_n = \frac{n\lambda}{a}$$

For the 1<sup>st</sup> dark fringe  $n=1$ :

$$\theta_1 = \frac{\lambda}{a}$$

## Position of any dark fringe

3) If the first dark point is at 1.2cm from the point O while using a blue radiation whose wavelength is  $\lambda = 500\text{nm}$ . Determine a.

From the geometry of the figure:

$$\tan \theta_1 = \frac{x_1}{D} \Rightarrow$$

$$\theta_1 = \frac{x_1}{D}$$

$$\theta_1 = \theta_1 \Rightarrow$$

$$\frac{\lambda}{a} = \frac{x_1}{D}$$

$$a = \frac{\lambda D}{x_1} \Rightarrow$$

$$a = \frac{500 \times 10^{-9} \times 2}{1.2 \times 10^{-2}} = 8.3 \times 10^{-5} \text{m}$$

Figure 1

# Intensity distribution of a Diffraction Pattern

The variation of intensity of light ( $I$ ) as a function of the angle  $\theta$  or  $X$ .

The Intensity is maximum at the center of the C.B.F.

The Intensity decreases as going from the center to reach zero at first D.F.

The intensity then increase again to another value at the middle of first B.F, then decrease again to zero at second D.F...

# Intensity distribution of a Diffraction Pattern

## Application2:

A laser beam of light, of wavelength in vacuum  $\lambda = 0.5\mu m$ , falls normally on a horizontal slit of width  $a = 0.1mm$ .

The diffraction pattern is observed on a screen placed perpendicularly to the laser beam at a distance  $D$  from the slit (figure 1).

Figure 1

# Intensity distribution of a Diffraction Pattern

An appropriate device records the intensity of the light received from  $S$  on the screen ( $E$ ) as a function of  $x$ .

The curve in figure 2 shows the intensity as a function of  $x$ .

Figure 2

# Intensity distribution of a Diffraction Pattern

- 1) Specify the nature of the point of abscissas  $-0.5\text{cm}$ ,  $0$  &  $0.75\text{cm}$ .
- 2) Indicate the position of the first and second dark point from the positive side.
- 3) Refer to figure 2, give the linear width of the central bright fringe  $L$ .
- 4) Give the expression of  $L$  as a function of the given.
- 5) Deduce the value of  $D$ .

# Intensity distribution of a Diffraction Pattern

1) Specify the nature of the point of abscissas  $-0.5\text{cm}$ ,  $0$  &  $0.75\text{cm}$ .

Figure 2

position	-0.5cm	0	0.75cm
nature	1 <sup>st</sup> D.F in negative side	C.B.F	Center 1 <sup>st</sup> B.F in positive side

# Intensity distribution of a Diffraction Pattern

2) Indicate the position of the first and second dark point from the positive side.

- The first dark point at  $0.5\text{cm}$ .
- The second dark at  $1\text{cm}$

Figure 2

# Intensity distribution of a Diffraction Pattern

3) Refer to figure 2, give the linear width of the central bright fringe L

The C.B.F is between the 1<sup>st</sup> D.F from the positive side to the 1<sup>st</sup> D.F from the negative side:

$$L = 0.5\text{cm} - (-0.5\text{cm})$$

$$L = 1\text{cm}$$

Figure 2

4) Give the expression of L as a function of the given.

$$L = \frac{2\lambda D}{a}$$

# Intensity distribution of a Diffraction Pattern

5) Deduce the value of  $D$

$$L = \frac{2\lambda D}{a}$$

$$D = \frac{La}{2\lambda}$$

$$D = \frac{1 \times 10^{-2} \times 0.1 \times 10^{-3}}{2 \times 0.5 \times 10^{-6}}$$

$$D = 1m$$

# The End
